## FORESTRY PROJECTS **FORESTRY IN ITALY**

AzzerCO<sub>2</sub> promotes and realizes forestry projects in Italian national, regional and urban parks. The main idea is to increase the green surface in Italy by planting new permanent forests. Each forestry project uses local autochthonous species, respects the territory's natural biodiversity, and is managed in accordance with the sustainability criteria defined by the Ethical protocol of the Parchi per Kyoto committee.

The carbon sequestration is calculated in line with the IPCC Guidelines and UNFCCC CDM - approved methodologies. The emissions reductions are verified by independent certification bodies like RINA and the Forestry Department of the University of Tuscia.

Each of AzzerCO<sub>2</sub>'s clients can offset his carbon by creating his own green area within the project area and by financing thereby tree planting activities for a quantity of trees that correspond to the GHG emissions associated with his activities.
